Universidad de Navarra

«Human knowledge and animal knowledge»

Résumé:

It is easy in principle to understand what cognition is, but difficult to define it. Furthermore, the extent of this phenomenon is a controversial issue. From those who identify it in the most primitive forms of life to those who believe it possible to assign it to artificial entities. In this seminar I will ask if cognition presupposes life and if, among the various ways in which it is realized, human cognition differs from the rest to the point of considering it essentially different
